

Chapter 9

Power Functions

9.1 Power Functions with Positive Integral Powers

A power Function has the form

$$y = kx^p$$

where k and p are constants. The simplest power function is $y = x$, where $p = 1$. Its graph is linear. However not all other power functions look linear.

9.1.1 Visualizing Odd Power Functions

Example 1

Graph the following and generalize the shape of the graph.

$$Y1 = x^3$$

$$Y2 = x^5$$

$$Y3 = x^7$$

Press **Y=** **CLEAR** to erase all old functions.

Enter the above functions (see Figure 9.1). Set your WINDOW as in Figure 9.2. Press

GRAPH (see Fig. 9.3).

The graphs go through the origin $(0, 0)$, have both positive and negative y values and have a "lazy S" shape. As you move left to right the functions are always increasing.

A look at the table of values, in Figure 9.4, shows that for the odd power functions as x increases to $+\infty$, y increases pretty fast to $+\infty$. As x decreases to $-\infty$ y decreases to $-\infty$.

Press **ZOOM**; select [3:Zoom Out] (see Fig.

9.5). The calculator gives you a chance to reposition your cursor; then press **ENTER**

(see Fig. 9.6). This shows that all the graphs have a similar shape or "global behavior."

9.1.2 Visualizing Even Power Functions

Example 2:

Graph the following and generalize the shape of the graph.

$$Y1 = x^2$$

$$Y2 = x^4$$

$$Y3 = x^6$$

Figure 9. 1

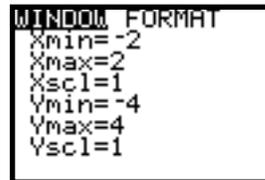

Figure 9. 2

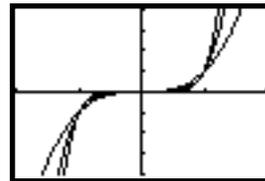

Figure 9. 3

| X | Y1 | Y2 |

| -200 | -8E6 | -3E11 |
| -100 | -1E6 | -1E10 |
| 0 | 0 | 0 |
| 100 | 1E6 | 1E10 |
| 200 | 8E6 | 3.2E11 |
| 300 | 2.7E7 | 2.4E12 |

Figure 9. 4

Figure 9. 5

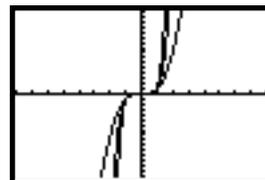

Figure 9. 6

Enter the functions into **Y=** . Reset the WINDOW as in Figure 9.2 or press **ZOOM** <Memory>; select [1:ZPrevious].

Press **GRAPH** (see Figure 9.7).

The graphs go through the origin (0, 0), have only positive y values and have a "U" shape. As you move from negative values to positive values of x the functions have large positive values then decrease to zero then increase again. A look at the table of values, in Figure 9.8, shows that for the even power functions, as x increases to $+\infty$, y increases pretty fast to $+\infty$. As x decreases to $-\infty$, y increases to $+\infty$.

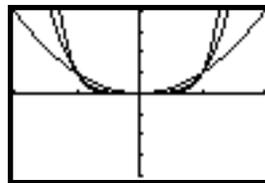

Figure 9. 7

| X | Y1 | Y2 |
|------|-------|-------|

```

Figure 9. 9

9.1.3 Polynomial Functions

When positive integer power functions are added together you get a polynomial function:

$$y = a_n x^n + a_{n-1} x^{n-1} + \dots + a_1 x^1 + a_0$$

where a_n is a constant coefficient ($a_n \neq 0$), and n is a positive integer power.

Example 3

The deer population in a national forest was monitored over a 25 year period. The data collected can be modeled by the fifth-degree polynomial:

$$D(x) = -0.125x^5 + 3.125x^4 + 4000.$$

Graph the function and interpret the graph.

Let $Y1 = -0.125x^5 + 3.125x^4 + 4000$
(see Fig. 9.9).

| X | Y1 | |
|---|--------|--|
| 0 | 4000 | |
| 1 | 4003 | |
| 2 | 4046 | |
| 3 | 4222.8 | |
| 4 | 4672 | |
| 5 | 5562.5 | |
| 6 | 7078 | |

X=6

Figure 9. 10

| X | Y1 | |
|----|--------|--|
| 18 | 101741 | |
| 20 | 104000 | |
| 21 | 101241 | |
| 22 | 91846 | |
| 23 | 73960 | |
| 24 | 45472 | |
| 25 | 4000 | |

X=20

Figure 9. 11

Note: Use the table of values to find the appropriate WINDOW.

Press **2nd** **TblSet** . Let TblMin = 0 and $\Delta\text{tbl} = 1$. Press **2nd** **TABLE** (see Figs. 9.10 and 9.11). It looks like the maximum population occurs around 20 years. Set the WINDOW as in Figure 9.12.

```

WINDOW FORMAT
Xmin=-10
Xmax=30
Xscl=1
Ymin=-100000
Ymax=120000
Yscl=10000
    
```

Figure 9. 12

Press **GRAPH** , then **TRACE** to explore the graph (see Fig. 9.13).

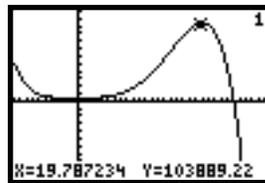

Figure 9. 13

Interpretation:

It took 20 years for the deer population to go from 4000 to a maximum population of about 104,000. Over the next five year period the population decreased back to 4000. The sharp decrease was probably a result of a lack of food supply caused by over population and/or disease.

9.1.4 Power Regression Equations.

Example 4

Below are some data reported on AIDS in women. Find a power regression equation that models the data.

| Year | AIDS Cases |
|------|------------|
| 1 | 18 |
| 2 | 30 |
| 3 | 36 |
| 4 | 92 |
| 5 | 198 |
| 6 | 360 |
| 7 | 631 |
| 8 | 1016 |
| 9 | 1430 |

Note: Clear functions from $Y=$ and turn OFF all plots.

- Enter the data in L1 and L2. Press $\boxed{\text{STAT}}$ [1:Edit] (see Fig. 9.14). Press $\boxed{2\text{nd}}$ $\boxed{\text{STATPLOT}}$ $\boxed{1}$ and set up the plot as in Figure 9.15. Press $\boxed{\text{ZOOM}}$; select [9:ZoomStat] (see Figs. 9.16 and 9.17).
- Find the regression equation. Press $\boxed{\text{STAT}}$ $\boxed{\triangleright}$ to <CALC>; select [B:PwrReg] $\boxed{2\text{nd}}$ $\boxed{\text{L1}}$ $\boxed{,}$ $\boxed{2\text{nd}}$ $\boxed{\text{L2}}$ $\boxed{\text{ENTER}}$ (see Figs 9.18 and 9.19).
- Put the equation into Y1. To paste: *Press $\boxed{Y=}$ $\boxed{\text{VAR}}$; select [5:Statistics] $\boxed{\triangleright}$ $\boxed{\triangleright}$ to <EQ>; select [:RegEQ]. Press $\boxed{\text{GRAPH}}$ (see Fig. 9.20).

*** TI-83 NOTE:** Press $\boxed{\text{STAT}}$ $\boxed{\triangleright}$ to <CALC>. Select [A:PwrReg], $\boxed{2\text{nd}}$ $\boxed{\text{L1}}$ $\boxed{,}$ $\boxed{2\text{nd}}$ $\boxed{\text{L2}}$ $\boxed{,}$ $\boxed{\text{Y1}}$ to directly store the equation into Y1

The power function fit is pretty good in the beginning, but not so good at the end.

Example 5

Find other polynomial regression equations (quadratic, cubic, or quartic) and an exponential equation.

Repeat steps 1 - 3 above choosing different regression equations. Then use these models to predict future AIDS values. Graphing screens will not be shown.

Figure 9. 19

TI-83. Turn DiagnosticsOn under CATALOG to see r.

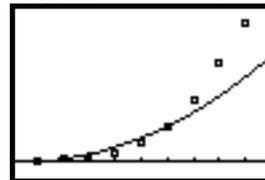

Figure 9. 20

Example 6

Compare the graphs of negative integer power exponents and generalize about odd and even negative integer powers.

First Graph:

$$Y1 = x^{-1}$$

See Figure 9.21.

Press **ZOOM** select [4:Decimal] (see Fig. 9.22). This graph is in two pieces, since $x^{-1} = 1/x$, so $x \neq 0$, and it is symmetric to the origin.

Graph other negative odd integer powers:

$$Y2 = x^{-3}$$

$$Y3 = x^{-5}$$

Enter the functions into Y1 and Y2. See Figure 9.23

Press **GRAPH** (see Fig. 9.24)

To the right of $x = 0$, the function is at a large negative value and decreases rapidly to zero. As $x \rightarrow +\infty$, $y \rightarrow 0$.

To the left of $x = 0$, the function is near zero and decrease rapidly to large negative values. As $x \rightarrow -\infty$, $y \rightarrow 0$.

Graph even negative interger powers:

$$Y1 = x^{-2}$$

See Figure 9.25. Press **GRAPH** (see Fig. 9.26). This is a reasonable graph because $x^{-2} = 1/x^2$, so $x \neq 0$ and all y values are positive. This graph is symmetric to the y -axis.

Graph other even negative integer powers:

$$Y2 = x^{-4}$$

$$Y3 = x^{-6}$$

Press **Y=**, enter the functions into Y2 and

Y3. Press **GRAPH** (see Fig. 9.27).

Once again the functions have the same general shape as x^{-2} with all positive values. On either side of $x = 0$, the function goes to a positive infinity. As one moves left to right the curve begins near zero and increases to $+\infty$. At $x = 0$, the function is undefined. To the right of zero the function is at $+\infty$ and decreases rapidly to zero.

Troubleshooting: For x^n where n is a decimal value (non-integer) the domain of the function is limited to $x > 0$. You will only see one-half of the power function.
